

Building an AI-assisted workflow with Omni in Airtable

SPEAKER OUTLINE / STEPS 1-8

- 01** Build the first dashboard with my lame prompt.
Ask Omni to create an interface for paraprofessionals to track case tasks. Have it show me the plan before I approve the build.
- 02** Ask Claude to improve that prompt using /omni-prompt.
The skill turns a rough request into clear, specific instructions for Omni.
- 03** While Claude writes, ask Omni about the data in the first dashboard.
What are the most common tasks? How many different tasks are there?
- 04** Ask Omni to create tags to categorize the tasks.
It says it can't. Show what happens when I start a fresh chat.
- 05** Try a slightly different version of the same request in the new chat.
This time, Omni creates the tags field.
- 06** Open the agent field and inspect what Omni wrote.
Show the instructions, category options, automatic-generation toggle, and conditions for running the agent. Explain that building it doesn't use AI credits, but generating its output does.
- 07** Return to Claude's four prompts and build the second dashboard.
Task list, calendar, board, then record details and tidy-up.
- 08** Publish the interface.
This is where I lose the thread.

Speaker outline

STEPS 9-15

- 09** Show Omni offering alternatives when it can't carry out a request.
Run one of its suggested prompts and show the result.
- 10** Return to the interfaces and show the third dashboard.
Built from the custom prompt Omni created. Three versions: my original prompt, Claude's improved prompts, and Omni's custom prompt.
- 11** Show the initial home-visit reminder automation.
Omni built the first version, but it wasn't ready to ship. Show how I used Claude Code to finish the remaining details and publish it.
- 12** Use Claude in the browser to find the interface's source code.
Give that code to Claude in the browser and run the Airtable Omni Custom Interface Refiner skill. The skill helps fix bugs, improve usability, and add custom interactions. Give the refined code back to Omni to build.
- 13** Review the output and keep iterating in Claude Code.
Run the Airtable Omni Custom Interface Refiner skill again with my feedback, then review the next version.
- 14** I'm sharing the Questwood source code, the original Omni build prompt, and both skills on my GitHub.
Omni Prompt Generator (omni-prompt): turns rough ideas into specific prompts for Omni.
Airtable Omni Custom Interface Refiner (airtable-omni-refiner): helps fix bugs and improve Omni-generated interface code.
The full prompt that built the first custom Questwood is included in the appendix.
- 15** These skills are a starting point.
You'll likely need to tweak them for your LLM and system.

Questwood: original build prompt

APPENDIX / OMNI PROMPT

Interface name: Questwood

Source tables: Case Tasks and Staff

Base: appY3L5TcbLUcie6d

Instructions (prompt): You are a game designer building an interactive task-completion game for paraprofessionals. Create a NEW custom interface with one complete “Questwood” page.

1. AESTHETIC

Create a cozy enchanted woodland: illustrated trees, mushroom cottages, friendly animal companions, parchment mission cards, moss green, warm cream, terracotta, and golden rewards. Completing work makes the player’s garden grow. Use readable typography, charming illustrations, and subtle animation.

2. PLAYERS AND MISSIONS

Use Staff records with {Role} = Paraprofessional as players; display {Staff Name}. Default to all paraprofessional Case Tasks using {Responsible Role}. Include an optional player picker through {Assigned Staff}; do not filter by logged-in user.

Show {Name}, {Application}, {Status}, {Internal Due At}, and {Timing Alert}. Include search, status filters, and expandable {Notes}. Sort incomplete tasks by earliest deadline.

3. REAL TASK CONTROLS

Provide “Start” → In progress, “Complete” → Complete, and “Reopen” → Open. Save to {Status}; synchronize {Done}. On completion, populate {Completed At} if blank. Preserve the timestamp when reopening.

Respect edit permissions, prevent repeated submissions, and show save errors. Celebrations happen only after successful saves.

Questwood prompt, continued

APPENDIX / OMNI PROMPT

4. POINT SYSTEM — REQUIRED

Every distinct task currently Complete is worth 25 XP. Split those points equally among its linked paraprofessional staff. Unassigned tasks contribute only to the team total.

Calculate scores from Airtable records, including existing completed tasks. Reopening removes that task's contribution; recompleting restores it without duplicate points. Scores must survive refresh.

Show XP prominently, each task's reward, completed-task count, and progress toward the next level. Every 100 XP earns a level and a new garden decoration.

5. LEADERBOARD — REQUIRED

Keep a visible leaderboard beside the missions. Show rank, player name, XP, level, and completed-task count. Equal scores share rank. Highlight the selected player.

Calculate rankings across all eligible tasks, regardless of search or display filters. Update after successful status changes. Do not use Dino Scores.

6. GAME FEEDBACK

After completion, grow a flower, animate earned points toward the scoreboard, and reveal earned decorations. Make locked rewards clickable to explain their XP requirements. Support reduced motion.

7. VALIDATION

Verify completion updates the record, points, garden, and leaderboard; refresh preserves results; reopening reverses points. Include loading, empty, and error states.

Use existing fields only. Don't invent scores, players, or task data. Flag missing configuration instead of creating substitutes.
